

# Maternal Microbiome *Legacy* Project

Some research shows a potential link between the type of delivery (vaginal or cesarean) and a baby's gut bacterial community (microbiome), which may influence the risk of conditions like asthma and allergies later in life. However, we do not have all the answers. Help us learn more!

The study will examine your microbiome at delivery and in your baby in the first 3 months of life. Our goal is to better understand the connection between your microbiome and the development of your baby's microbiome.
